

Toy 1: absolute-position decoding

The target is a signed combination of values at fixed absolute positions within the window.

$$y \sim \sum_i c_i x_{t-i} + 0.22 \tanh(x_{t-11} - x_{t-3}) + 0.10 x_{t-9} x_{t-2}$$

Orange and blue cells indicate positive and negative positional weights, so order cannot be ignored.
